We transform communities and our people,
by optimising and building structures that matter together.

What we do

We're specialist fabricators of heavy and complex structural steel. We collaboratively build structures, from design optimisation through to installation, that benefit many Australians.

68 Weber Road, Bowhill SA 5238

BLN: 166373

ABN: 33 911 388 370

Core Values

We do what we
say we are
going to do

We get things
done, together

We Work
Smarter

We help
our clients
win

Bowhill Engineering has enjoyed significant growth over the last 5 years and is highly regarded by its customers and stakeholders as a South Australian success story. The company is seen as having a unique position in the market, specialising in large and complex steel structures.

Bowhill Engineering's recent growth has been driven through nurturing collaborative relationships with major construction partners and delivering solid performance on large-scale infrastructure projects (primarily road projects with bridge components).

Customers value the relationship that they have with the Bowhill team, the honesty and transparency, the expertise and (proactive) initiative provided, ensuring cost effective and constructable solutions.

JWPM Consulting – Summary of their External Scan

Core Competencies

In an increasingly competitive and high-stakes infrastructure game, you need a bidding edge. And the bidding edge comes from working with a specialist heavy and complex steel fabrication supplier who will partner with you — not just take your order.

Smarter together

Design optimisation specialists in large, welded components

We start by bringing together a team of experts across design, surveying, drafting, engineering, fabrication, surface treatment, transportation/logistics, and erection to ask the questions others don't and find the efficiencies others can't.

Win before you start

Cost with certainty

When you're looking for specialist heavy and complex steel engineering, most fabricators talk quality; we've got 40 years demonstrating it. Our facilities and equipment are set up to handle the heavy, large and complex parts of any project — think ferry hulls and 50m long road bridge girders.

Complexity done excellently

Systems and process, refinement

We're able to offer certainty of costs because we control our end-to-end process by designing, fabricating, preparing, and painting all our steel under one roof. By being able to take care of the transport through to on-site erection, we're able to control what happens to the whole process.

Committed to our community

Strengthen our region

Helping the community isn't something many structural steel engineers boast about, but as a multigeneration family-owned business, contributing to our community is part of our DNA — and it's what sets us apart.

Safety

WHSE Statistics updated monthly – includes LTIFR (Lost Time Injury Frequency Rates)

We work together to ensure we are safe.

We have developed a system that unlocks the combined energy of a highly engaged hazard committee. We remain focused on proactively reducing the risk of injury to all of our staff, and indeed anyone that visits our facility or works with us on our site or our customer's site.

“Working with clients such as McConnell Dowell, Oz Minerals, DIT & tNSW have seen Bowhill Engineering build QA systems 2nd to none. Clients love our accuracy & timeliness of our documentation and the surety in risk reduction.”

- Jodie Hawkes, Chief Financial Officer

- **ISO 45001:** 2018 Safety Management System

Energy, Emissions, Environment

Our facility is located on the beautiful Murray River in South Australia. Our passion is to not detract from our environment, we are committed to reducing our impact.

We have committed to our SET and use our ESG (Environmental Social Governance Framework to monitor our progress.

We also have a Community Energy portal which we share renewable energy with our community.

— Commitment to — **SUSTAINABLE ENERGY TRANSITION**

Bowhill Engineering and Maximum Energy have undertaken a collaborative, science based factual process to develop a comprehensive sustainable energy transition (SET) road map.

The SET road map is underpinned by a detailed baseline assessment of Bowhill Engineering's assets, programs and energy usage and has identified a broad range of opportunities for further energy efficiency, optimisation and offset with low-cost renewable energy.

Bowhill Engineering have committed to implementation of the SET road map which will build energy management resilience and deliver the following sustainability outcomes by 2028:

- 15% reduction in electrical power use
- 100% renewable sourced power by July 2022, including:
 - 50% of self-generated power
 - 50% of Community Energy sourced power
- Community Leadership through driving a local Community Energy Program
- 100% Renewable Energy by removing diesel fuel and other scope 2 emissions by 2028.

Maximum Energy will support Bowhill Engineering by facilitating governance and stewardship of the SET road map implementation through project management oversight, live performance data monitoring and leading edge technical support and guidance on sustainability improvement programs.

Compliance

We do things the right way, every time. No exceptions.

We're immensely proud of the fact we've embedded compliance into our culture. This dedication to doing things the right way for our staff, our clients, and our environment is how we're able to point to a track record in quality, safety, and environment that's unmatched in our industry.

“Bowhill Engineering's commitment to its Integrated Business Management Systems including Safety is by far the best that I have seen in a small/medium manufacturing business. Its commitment to process compliance via a sophisticated document management system that is easily accessible to all stakeholders is commendable.”

“Bowhill Engineering has always demonstrated outstanding communication whether it be complying with contractual obligations or conveying engineering solutions to enhance the overall project directives and timelines. Respect for our clients views and requirements have always been met with positive enthusiasm even when dealing with difficult or demanding circumstances. Their QA and safety systems are very mature and it is clearly evident that they take seriously their commitment to safety and quality, in both action and documented processes...”

- Mark Osborne, Business SA Advisor

Capability Statement

Bowhill Engineering is an innovative structural steel engineering firm with specialist capability in large complex steel structures. Founded in the early 70's, for the past 50+ years Bowhill has developed an enviable track-record for project delivery. Bowhill's reputation is built on:

- Specialising in large complex structural steel
- Being easy to do business with
- Offering a collaborative problem solving approach
- High capability for developing innovative solutions
- Track record for delivery-on time and with high quality
- Price competitiveness

Bowhill is widely recognised for excelling at technical challenges. Their collaborative approach draws together project stakeholders driving down the risk profile to ensure successful outcomes. Their geographic location suits their core competency and allows efficient transport anywhere in Australia.

Bowhill directly employs a stable workforce of 60+ highly specialised staff, this strengthens their community and provides the ability to deliver world class innovative solutions for their national clients. The firm delivers some \$12 million worth of landmark projects annually.

Bowhill lead the way with their integrated systems and professionalism, a “boutique” firm focused on a specialisation in a very specific niche in the construction market.

Regarded as specialists in complex & heavy structural steel

fabrication, particularly larger components. Bowhill have deliberately developed their core competency which has allowed them to highly progress their skills. When coupled with their purpose built fabrication facility complete with one of Australia's widest blast chambers, their competency is highly sought after. This allows Bowhill to produce these challenging size projects with absolute safety and the efficiency gained translates into competitive rates.

Bowhill's target markets include government infrastructure, mining, water, defence and commercial building - Bowhill Engineering have successfully completed many critically important projects for these industries.

Quality Policy Statement

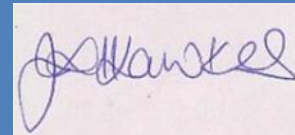

Bowhill Engineering is committed to quality providing our clients a Lean Business System that is an Integrated Management System that complies with ISO 9001:2015

Our quality objective is to meet or exceed all customer & applicable legislative requirements and expectations in a proactive, professional and cost-effective manner.

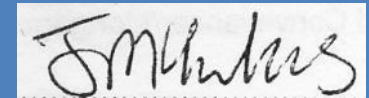

To achieve this objective, we will:

- Set objectives and targets to measure our performance and identify opportunities for improvement.
- Provide adequate resources to continually review and improve our business process and quality management system
- Encourage all people to integrate quality management into the way we work and promote its application as a method for continual improvement within their area of responsibility.
- Actively seek performance feedback from our customers and address opportunities for improvement that are identified.
- Ensure that we communicate our commitment to quality to our staff using a variety of methods.
- This policy and associated documents shall be subject to continuous review.

This policy applies to 68 Weber Road, Bowhill SA 5238 and includes all business activities, operational activities and administration services associated with heavy and complex structural engineering, located at this site. This policy is to be read in conjunction with our [Integrated Systems Management](#) Manual. It applies to all staff, clients, customers, suppliers and sub-contractors whilst they are located on our site. The IMS Manual is the over-riding top document.

Together we Thrive

Facilities & Equipment

- 2,500 m² — Main Workshop Assembly 25m span open layout for larger components
 - 2 x 20t Overhead gantries
- 1,000 m² --- Assembly Workshop
- 1500m² - B5 High lift Workshop – 23m high (*expected completion date late 2023*)
 - 1x 100t (16m hook height) & 2 x 32t (12m hook height) Overhead Bridge Cranes (20m span)
- 20,000 m² of Onsite Storage with 5+ acres of hard stand area (6.7 hectares – total land package)
- Onsite lifting equipment:
 - 1x 33t capacity forklift, 1x 16t, 2x 12t capacity forklifts, 1x 8t, 2x 4.5t and 4x 2.5t
 - 2 of 70t heavy duty engineered jinker units complete with hydraulic lifters on each unit
 - Movement of up to 140t items on site can be achieved easily and storage onto our large range of rated trestles for easy loading onto road transport.
- Heavy Lift Truck Trailer combination:
 - Subcontractor; intra and interstate movement of up to 65m long, 150t, 5m wide 6+m height segments
- Welding equipment (Mig Welders):
 - WIA, CIG Mig welders, all approx. 400-500a with remote wire feeders
 - 2x sub arc welders 1000 Amp (Lincoln, Esab)
 - 2x Stud Welders (Soyer – up to 22mm diameter studs)
- 1000m² Surface Treatment Facility:
 - Surface treatment undercover area is insulated and climate controlled
 - Blast chamber 8.1m wide – widest in SA (capable of coating 70m long items undercover)
 - 4 blast nozzles at once via a 6t Mega Blast Pot
 - EPA approved
- 400t+ of Temporary steelwork for modification and hire:
 - Large road frames and crane mats
 - Bridge support towers (for use with SPMT's)
 - Spreader beams, headstocks, props
 - Formwork, sand jacks, temporary bearings, packers etc

Services

Bowhill Engineering have a proven track record, the many benefits to our clients are enforced by the rock solid reputation that we've built over some 40+ years in business.

Methodology Development

Our wealth of experience, innovative staff and state of the art software, well equips us to serve our customers with safe, efficient and synchronized methodologies. ECI type contracts or complex tasks that need "proving" before manufacture are common for Bowhill Engineering. 3D simulation enables us to electronically trial proposals, identifying the merit from a physical, safety and practical, standpoint.

A strong methodology development capability allows us to maximise build-ability and accuracy.

Speed and Accuracy

Drafting using Tekla 3D software and the associated free Trimble Connect collaboration software has allowed us to achieve lean manufacture principles and error proofing through all project stages. This results in NC format files (which are developed straight from the project model) being sent via email straight to the steel merchant for CNC processing. Accuracy and speed are huge advantages resulting from this process.

Metrology

Bowhill have recently developed in-house technology to accurately measure larger items in 3D using our Trimble X12laser scanning tool. This is a survey grade machine that can also provide laser scanning to ensure accuracy via electronic comparison to the 3D model.

“

We do things for our customer's convenience, not our own

”

- Jeremy Hawkes, Managing Director

Services (cont.)

Value for money

With a committed stable and experienced workforce (average staff retention rate in excess of 5 years), recruited for their unique skill and experience, we are able to reliably produce structural fabrication components of exceptional quality at competitive market rates. We do this through our lean manufacturing processes as well as utilising SA's extensive industry supply chain. We manage the potential risks of outsourcing by fostering strong supplier networks and contracts.

This approach is an extremely effective way of achieving an impressive result for all stake holders on a project. Minimization of capital outlay reduces costly overheads, increases our overall capacity and benefits our clients through the resulting low cost structure. This strategic approach allows an impressive quantity of available capability, whilst allowing a nimble structure with diverse skills. This ability to be very flexible and adaptable can be applied to many different challenges and industries without compromising our core focus of heavy and complex structural steel.

Reputation

We have runs on the board. By nominating us on your project team, your clients or stakeholders will be favourable to your overall proposal.

Bowhill Engineering have been active in the building and construction industry since the late 1990's. Our reputation is something that we are passionate about and something that we take great care of. As you well know, in this industry any

mistakes are well known and reputations are easily damaged. Throughout this entire time Bowhill Engineering have not one tarnish on their reputation, quite a testament, and rarely seen.

Surface Treatment

A modern surface treatment facility that is specifically designed to efficiently handle large components, in an environmentally sensitive way. Our Blast room is one of the widest in Australia! The ability to complete this critically important process on our manufacturing site is hugely beneficial to you as our client because it results in savings, quality control and effective loading on transport. In simple terms we can ensure that you get what you want, when you want it! Without this in-house service other fabricators are at the mercy of the industry, and they simply do not have the control that this critical process demands.

“ This process protects the clients valuable investment, it must be right ”

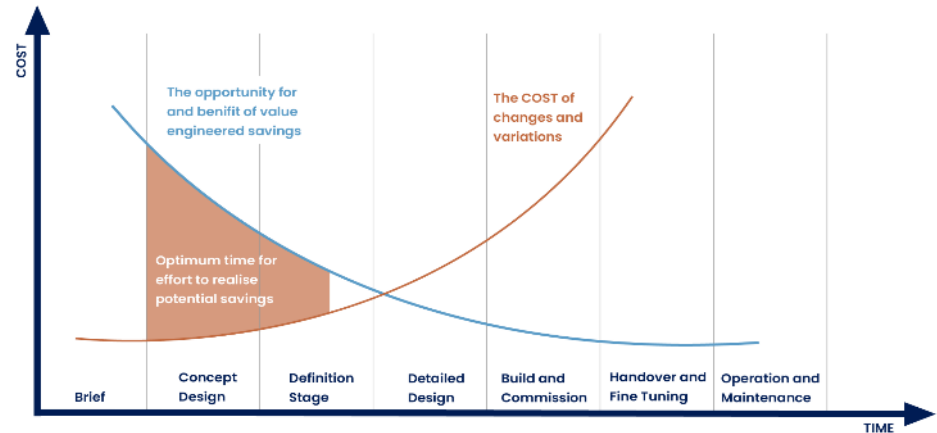

- Tom Dennis, Production Manager

Early Contractor Involvement (ECI)

Why assembling the right construction team early creates winning outcomes

Our experience tells us that there are fantastic, mutually rewarding and industry building solutions waiting to be discovered. It just requires the right approach to unlock them. We all want a competitive advantage, we all want to lower risk and increase performance and profit, could this ECI approach be the most effective way to do all of this, for all parties?

There are many positive outcomes that we have seen as a result of our involvement in this approach and they are experienced by everyone involved, not just from our perspective as a subcontractor.

The next-level understanding of critical trade nuances is normally out of reach of designers and contractors because trades keep their secrets as their own IP. Sharing of knowledge helps to drive down risk, drive up smart, thoughtful and efficient design and encompass the overlapping and inter-dependent trades.

Building relationships with the best subbies in the industry is a smart approach, it helps your organisation and limits your competitors access to them. Learning together and creating an inter-dependent culture where "none of us are as smart as all of us" make a strong team approach. Very hard to keep success away from a strong team! Wining, but not at someone else's expense! Winning together!

Magic can happen, industry norms can be surpassed with better more unified design that supports the whole supply chain and program.

- With the right people (experienced in diverse but complimentary ways),
- Working together to an aligned goal, where all parties can benefit from smarter solutions
- Freedom for brainstorming and challenging the status quo and inter-dependent exchange of ideas

Low Risk

Risk minimization is paramount to us. We ensure that our systems and procedures are sound and robust. Being accredited for Quality, Safety & Environment as well as Pre-Qualification for industry groups such as NSSCS to an impressive CC3 level, ensures we maintain the high standards that you expect and that we have set for ourselves. Continuous Improvement utilising project debriefs and being dedicated to then developing the most efficient preventative systems allow us to move the wheel of progress without slipping backwards.

We have a dedicated management representative working to ensure all Policies & Procedures reflecting current work practices. We are extremely proud of the way we “choc the

wheel” which ensures that our Risk Management Policy is relevant & impactful.

“ We have a passion for what we do, the prospect of building something like a complex pedestrian bridge gets us very excited ”

- Jeremy Hawkes, Managing Director

Early Optimisation

Regency to Pym

Client Name: McConnell Dowell

Year Completed: 2020

Early design optimisation; helped set this project off in the right direction. The macro level trade considerations such as mill plate sheet size availability, cross section and girder length/weight limitations, weld joint design and the like were considered as early as the main contractor tender stage. Bowhill were happy to provide this early input with no obligation and extend this service to other contractors who would like macro level trade focused feedback on concept designs.

Design coordination meetings; held (mostly via video conf) at regular intervals with the whole engineering and construction team helped to avoid a lot of time consuming RFI 's and clarifications during the engineering drawings development and shop drawing/modelling stage.

Project Modelling; The collaborative nature of Bowhill's modelling process is building towards having just one coordinated shop drawing and engineering model rather than separate engineering and shop detailing processes. This we believe to be a huge opportunity to further progress towards true BIM practices and to build the coordinated process that captures many win-win outcomes for all stakeholders. It can't be understated the learning process that happens as a spinoff benefit from these collaborative discussions. The learning transfer happens across the full spectrum of stakeholders it is not one way from learned to practical as you might expect, rather even senior engineering and construction staff can gain practical insights from trade focused collaborators & visa-versa.

R2P (cont.)

Temp Works; The use of temp works on this project has been significant mainly due to the installation methodology where the majority of the bridge is pre-built, finished from insitu slab, road surface, barriers etc right up to light pole bases and then installed using an SPMT (similar to the Darlington road bridges a few years ago). In this instance, the prebuild happens some 500m from the permanent location and occurs as 2 x 1300t 84m long x 15m wide sections of bridge supported at permanent height of around 6m to underside of girders. A significant scope and with the innovative reuse of 200t of previously used steel (+100t of new steel), we've done this work at lower cost than new steel only (\$1m for all new verses \$500k mix of new and repurposed).

Implemented Learnings

Flinders Link Railway Bridge & Temporary Steelwork

Client Name: Gateway South (Fulton Hogan)

Year Completed: 2018-2019

20 Open top box girders for the Railway Bridge simply supported girder segments

Implementing learnings;

Being the 4th steel bridge at this project site, the efficient design features that had been uncovered on previous scope packages were fed into the design development for this bridge.

This assisted with speeding up the design process and allowing cost savings to be realised by the Gateway JV during the tender period.

Bowhill were active in sharing and assisting in this process and full credit to the Gateway team for pursuing this continuous learning discipline.

We believe that these initiatives are helping to strengthen the case for building steel bridges in favour of other competing materials.

Sand Jacks

Sand Jacks; Engineers specifications increasingly state that Bridge girders are not to be installed directly onto the permanent bearings. This lends itself to an opportunity for an innovative solution.

Bowhill have been providing their inhouse IP for this solution via their modular sand jacks. These jacks can be pre-set at the required height and can accommodate the unforeseen loads during the construction process. Then once all works completed, they can be safely lowered in a controlled manner without the use of any complicated or expensive mechanical, electrical, or hydraulic assistance.

It's as simple as either blowing out the sand with compressed air or some site teams have even used a vac-truck to remove the sand and avoid any need for clean-up. We now have a range of these jack kits in stock ready for incorporation into our next project.

Offsite Pre-Assembly

Williams Street Bridge, South Yarra

Client Name: Railway Alliance Australia

Year Completed: 2019

Railway Corridor Challenges: Right from the start this project had some ambitious goals, being a bridge within the rail corridor in Melbourne. The window for closures to install were small and difficult to change.

This being the case the Metro Tunnel/RIA team needed the surety that everything would fit 1st time to allow the erection of the whole bridge and trans-floor slabs to happen in just one weekend.

This coupled with a very tight construction timeline leading up to the install generated a massive challenge for Bowhill and indeed RIA.

Add to this situation the requirement to pre-assemble the main elements off site (at Bowhill) to guarantee fit-up on site and the stage was set for one heck of a project.

Offsite Pre-Assembly (cont...)

Bowhill's team worked big hours and adopted some innovative procedures to bring the fabrication and welding into line with the program. Next challenge was taking the main elements (some only partially completed) out of the workshop to allow the full-scale trial assembly without "burning" too much program.

Fortunately, Bowhill had only just finished the civil works for their 110mx110m hardstand extension which was available in perfect time for this significant prebuild of the 60m x 25m x 4m deep main girders.

Bowhill's CC3 compliance (NSSCS) was another big tick to the RIA project team, it also provided them the piece of mind that the systems and procedures required for bridge building were thorough and complete and would not hinder the project.

Safety/efficiency; To safely use the onsite crane's maximum allowable rating Bowhill provided the data from an in-house developed calibrated weighing system. This data extended to all larger elements and was done after surface treatment to ensure absolute data integrity and lift planning surety. We offer this service to all of our clients as a value add now.

Timing; It is testament to the whole team that the entire structure was able to be safely erected over the rail corridor within RIA's ambitious program of just one weekend.

Saved \$350k and 4 weeks on Critical Path

Darlington Bridge 3, 14 & Temporary Steelwork

Client Name: Gateway South (Fulton Hogan)

Year Completed: 2017-2018

During the main contractor tender phase Bowhill Engineering helped our client Gateway South (Fulton Hogan/Lang O'Rourke JV) flesh out some critical constructability feasibility checks. This process was done well before award of the contract to Gateway and hence well before any contract being negotiated with Bowhill Engineering. This process uncovered some important budgeting information to allow our client certainty with their bid to the project client (DPTI). Early Engagement is something that Bowhill Engineering invite on important projects where there are genuine opportunities to find better ways to improve the scope. This service is offered without any expectation, a reliance only on openness, innovativeness, honesty and helpfulness shines through and this alone often sees us being chosen to represent our trade during the actual project.

Darlington (cont.)

Darlington Bridge 3, 14 & Temporary Steelwork

During the project Gateway asked us to provide additional scope by way of the temporary steelwork that supported the nearly 12,000t of steel and concrete prior to its installation onto the permanent piers and abutments. Upon inspection, it was found that the initial design had some inefficient features, the clients budget was looking under serious threat. With some quick and innovative thinking between the client, their engineer and Bowhill Engineering staff, the cost to actually complete the temporary steelwork was reduced by some \$400,000, thus saving the clients budget and making the ambitious timeline to supply possible. Credit must be given to the engineer James Deane-Butcher from Robert Bird Group for the cooperative and flexible nature he had to our repeated requests towards tweaking the design to achieve significant efficiencies but still to maintain structural integrity.

RMS CC3 compliant steelwork for 2 haul road bridges in the Snowy mountains NSW. FPBW flange to webs, delivered to a remote and difficult to access site location

Collaborative Model Review

Oaklands Railway Station

Client Name: McConnell Dowell

Year Completed: 2018-2019

Oaklands Railway Station Project is a high profile striking architectural statement, it's also a complex structure comprising around 200 tonnes of steelwork. Our Client MacDow knew it was important to get the right contractor onto the team as the project's program was of huge importance to them and their client DPTI. The success of the project relied upon an incredibly smooth run and some hard work, we knew from experience that if it was coordinated and planned right, and the total construction team were on the same page, we had every chance of producing the miracle that MacDow was after.

Oaklands (cont.)

“ We opened the train station on Monday morning which was amazing to see. Thank you for all your assistance to get to this point. Bowhill have been massive contributors to the project, delivering \$1.5m of steel fabrication.

Bowhill's input and interaction during the latter stages of the design phase provided the Project with some fabrication smarts which was of great benefit with both time and cost.

The detailing by Steve Wurst and Steve Bown was outstanding and they really took on the challenges put before them with the difficult geometry of the canopy structure.

The fabrication and coating performed at Bowhill's workshop was completed to a high quality with minimal fuss and any hiccups were dealt with by Bowhill without the need for Project intervention. This is a great asset to have as a company and is exactly what the Project team is looking for in a subcontractor.

I look forward to working with Bowhill again on the next project.”

- Adam Downie, McConnell Dowell

We instigated weekly face to face meetings during the critical model development stage, attended by construction modeler, architect, engineering, MacDow, DPTI, ourselves and any other trade that was relevant at each stage. Boweng believe that this was the key to the project's success as issues were worked through in real time, all parties providing input allowing modeling to progress without being held back due to frustrating RFI's bouncing around in emails. However, the model wasn't just progressed, the collaborative approach saw many smart design features adopted, not from any one person's idea, but from a combination of everyone's knowledge and varied perspectives mixed into developing the final solution. We also brought peace of mind to the technical requirements due to having been CC3 certified to the NSSCS for a year already prior to starting work.

Unique, safe and efficient solution

O'Bahn Tunnel Props & Whalers (Temporary Works)

Client Name: McConnell Dowell

Year Completed: 2016-2017

During this project, there was an opportunity to develop an Innovative prop and prop release system to release the force from the temporary horizontal 300mm diameter CHS props once the permanent works were completed and the props were redundant. McConnell Dowell representative Jan Siebel suggested in a passing comment the possibility of using sand as the support and release system as they had used a similar system previously in a different format (vertical support and release of a large load) but they didn't really know how to achieve the different feat at the time. Taking this idea on as a challenge was instinctual for Bowhill Engineering with physical development initiated almost immediately utilising a sliding collar arrangement never before developed. Prototype and testing revealed that there was potential for this system to work successfully in the horizontal plane on a CHS prop.

O'Bahn (cont)

Engineering calculations and witnessed load testing/measurement completed the process with some slight tweaks and a setting procedure was formulated tested and documented. McConnell Dowell then verified our work through Aztec Analysis and production of the system onto all 50 units was rolled out. This system was seamless and the safety and productivity gains for our client was significant with release of the units being as simple as the removal of a drain bung, once force was released the props sat safely in place until their removal with a crane! The alternative prop release process that was proposed was a clunky method of using a custom hydraulic jack to ease the weight from each prop to enable release, all of this between 5-12m in the air and close to the top of the tunnel's recently installed concrete lid.

Award Winning Delivery Solution

Majors Road – Southern Expressway

Client Name: Lend Lease

Year Completed: 2014

Our clients budget for this work was tight which necessitated innovative thinking for us to be able to deliver the quality outcome, within budget. Transport was the key innovation that resulted in a very successful outcome for our client and for Bowhill Engineering.

32.5m long members are not straight forward to deliver to site in Adelaide's South. Our clients budget for this work was tight which necessitated innovative thinking for us to be able to deliver the quality outcome, within budget.

Major's (cont.)

“The surety that we realised through the delivery solution was outstanding, our installation process benefited greatly because of the flexibility that we had around crane and weather delays allowing for absolute control of our site resources without costly delay implications”

- Kevin Shine, Project Engineer, Lend Lease

32.5m long members are not straight forward to transport to any site, let alone Adelaide's South. To minimise traffic disruption and maximise efficiency, the decision was made to move all 8 bridge girders (total of nearly 80t) to the site in one movement. This saw the design of a purpose built transport and storage cradle to ensure a safe and damage free end result. Cradle had to allow the specific truck trailer combination enough room to reverse under the load, this heavy lift deck had the ability to hydraulically raise the trailer deck under the load which allowed the removal of the bolted legs once the load was secured on the trailer with a reverse of this methodology on site for unloading. Engineering calculations and detailed shop drawings were completed to allow for a safe, smooth and problem free execution of the plan.

The custom designed and built transport/storage cradle minimised damage to the coating system in the whole of project handling, zero double handling and maximum cure times were possible due to the methodology, this ensured a successful end result.

The delivery was coordinated so that the whole load was positioned directly adjacent to the permanent bridge site which allowed our client surety to directly unload and install the beams at their absolute convenience and without the need to double handle the heavy, yet delicate items. It proved to be a safe and efficient methodology of both transport and handling on site due to the reduced number of oversize loads on our public roads. There was an added bonus of not having the normal and often difficult coordination of site staff and expensive lifting equipment mobilisation and re-mobilisation for unloading of the items upon their immediate arrival on site on a weekend. This project won an Innovation Award through Lend Lease's National Operations.

New launch method saves client 2 months

River Murray Ferry Hulls

Client Name: DPTI

Year Completed: 2014-2018

Innovative Methodologies: Soon after award, Bowhill Engineering was able demonstrate proposals and work closely with the DPTI's design team to coordinate many constructability improvements, especially the longitudinal connection of the hull. Using our geographic location to our strength (next to the River Murray) we were able to build the 12m wide, 22m long 70t ferry complete at our manufacture facility (previous builds had been road freighted to Morgan in two halves). The benefits to the client included structural integrity, coating integrity, accuracy, and conveniently allowing DPTI to continue using their Morgan Slipway for some 2 months longer.

Technical Challenges: Large components, transported via river channel to DPTI dockyard.

Using a bold approach to this challenge we factored in an allocation for extensive temporary steelwork.

We designed this temporary steelwork together with our own engineering and drafting team to be able to launch the completed ferry at the river just metres from our manufacture facility. The coordination between permanent and temporary work packages was the key to the successful launch. The extensive modelling and simulation was done early to bring surety to the process.

Successful Outcomes: A slick methodology was the key to the success for this project, the large components being built on our site had to be planned and as a result the amount of DPTI's site activities were drastically reduced , a safer and much more convenient outcome for our client DPTI . 4 ferries were built in total over 4 years and 2 separate contracts.

Coating Details: Highly scrutinised 3 coat system internal and external on large modules..

Precision Pays off

Wayville Train Station 50m long Pedestrian Overpass

Client Name: McConnell Dowell

Year Completed: 2013-2014

Manufacture technique was critical to achieving success on this complex project. The Bowhill Engineering Team were able to be involved right from the start of the design process, allowing us to work closely with the clients design team to coordinate the longitudinal connection points with all disciplines in mind. The important design consideration included structural integrity, aesthetic implications, coating integrity, accuracy, transportability and assembly on site.

With this Complex 3 dimensional shape, irregular bays, and a tight timeline there were many traps, but we used a professional approach to this challenge and factored in an allocation for extensive temporary steelwork into our bid.

Wayville (cont.)

With close coordination we designed this temporary steelwork together with our own engineering and drafting professionals to mistake proof our permanent fabricated items. We treated the temp steel like part of the product and gave it the attention that it needed to achieve the precision. This coordination was the key to the successful manufacture and problem free fit up of the modules on site over the operating rail corridor (closed for only 2 hours to install each half).

Accuracy was the key to the success of this project, the very complex project progressed on schedule with the amount of site activities reduced and made safer for all trades due to the sound methodology that was developed at the start of the project.

The highly scrutinised 3 coat system with architectural finish top coat on 13 of large modules required minimal site repairs due to the bolted connection between the modules.

Tripling a mines capacity

Mindarie Mineral Sands Feed Hopper

Client Name: Murray Zircon

Year Completed: 2014

Murray Zircon had an ongoing throughput issue (bottle neck) in their mineral sands mining process. The in-pit feed hopper was not performing, it was inconsistent (constant hang-ups), and was constructed in a way that made clean up and maintenance highly restrictive and simply unsafe. Wayne Oliver the Maintenance Manager at Murray Zircon invited the Bowhill Engineering team to get involved in concept design for a new hopper, however the new hopper was to suit the existing mechanical equipment that was deemed still to be suitable. What followed was a fluent process whereby the engineering, drafting, client input and constructability were able to be considered carefully by way of the Tekla 3D model that was shared around electronically to the whole group via free viewing/visualisation software Bimsight. The newly designed feeder unit seemed to satisfy all client/operator requirements but also allowed efficiency from a manufacture and methodology perspective. Having a well-articulated design with in-built constructability efficiencies allowed Bowhill Engineering to quote with certainty on a known amount of scope with a competitive fixed price lump sum.

Tripling a mines capacity (cont.)

Survey of in-use existing equipment was necessary to ensure that fit up of re-used mechanical equipment was accurately detailed. The concept was based around the actual site requirements and product characteristics, with a high degree of importance placed on safe maintenance and operations personnel access and product capacity and material flow.

Because of the interactive and collaborative approach taken by Boweng and their design team, the engineer, draftsman and the client, a well worked model was produced and thoroughly scrutinised by all stakeholders with a multitude of different perspectives, without onerous design meetings and travel time etc. Murray Zircon stakeholders were ecstatic with the end result as the new feeder unit outperformed the existing unit by more than 100% going from some 150-200t per hour average to a consistent 500t per hour with the new unit and virtually no cleaning inside the unit. Existing Unit was stripped, new unit was delivered, assembled and commissioned within 48 hrs due to careful attention to detail and good fit up of components both new and existing.

“ We found the Bowhill team so easy to deal with, the process that they coordinated got the best out of everyone and the end result was impressive both in terms of reliable throughput, but also cleaning and maintenance of the unit in service. I would recommend Bowhill, particularly for projects that require innovative solutions ”

- Wayne Oliver Murray Zircon Maintenance Manager

NEXY Pedestrian Bridge over the Gawler River

Client Name: York Civil / Fulton Hogan

Year Completed: 2010

Scope of Project: Supply fabricate and surface treat and transport to site 2 bridge girders @ approx. 33m long each.

Innovative methodologies: By fabricating the 60m long bridge in 1 section (before we then separated it into its two sections), we were 100% confident of the correct fit up on site. This was important due to the size/cost of the lifting and access equipment on site to install the members.

Technical challenges: The fabrication of this job went very smoothly due mainly to the synchronisation of our drafting with the fantastic service we received from Pipe Profiling services in Queensland and the staff at PPS even helped us to develop a sound methodology for fabrication.

Technical challenges (cont.): We seriously didn't

need to touch these pipes, they were cut so accurately. Not bad considering the multiple pipe connections, complex cuts and allowance for the pre-cambering of the main 3 stringers.

Coating details: Painting these large sections was achievable through the use of our blasting and painting facility, 33m long sections completed undercover in a purpose built coating facility. Coating system included a full blast and 3 coats with an automotive grade top coat finish, paint mapping and detailed testing/recording.

Successful outcomes: Very highly scrutinised fabrication, welding and surface treatment procedures all completely satisfying our client and the principle DPTI. Quality plans and ITP were completed with little fuss in a professional and detailed and accurate manner.
